

CSUCI Datathon

Databook

1. **Island**
 - The Island that the fox was captured in.
 - SRI - Santro Rosa Island
 - SMI - San Miguel Island
2. **GridCode**
 - SRI - 18 grids (sites) trapped between July-Sept each year; each grid consists of 12 traps checked once each 24 hour period for 6 consecutive days
 - SMI - 4 grids (sites) trapped Sept each year; each grid consists of 18 traps checked once each 24 hour period for 5 consecutive days
3. **TrapResult**
 - Result of the Trap
 - OPEN - trap is open and undisturbed
 - FOX - fox in trap
 - SKUNK - skunk in trap
 - CLOSED - trap closed but otherwise undisturbed
 - RO - “raided open”, trap open, but bait is missing (bait can be removed by mice, insects, and birds, so does not necessarily indicate that target species visited the trap)
 - RC - “raided closed”, trap closed, and bait missing
 - ES - “escaped skunk”, skunk slipped out through door crack before biologist arrived; we can tell a skunk was present in trap from trenching and nesting material inside trap
 - EF - “escaped fox”, there was a fox in the trap but it escaped from the handler before a pittag could be recorded
4. **Pittag**
 - Unique identifier given to each individual captured (same as a microchip that cats and dogs get, inserted under the skin)
5. **CaptureType**
 - N - first time ever captured, receives pittag
 - P - previously pitted, but first capture of the trapping season (July-January)
 - R2 - recapture, has already been captured during this trapping session (grid)
 - R1 - has already been captured this trapping season (July-January), but this is the first time this season it has been captured at this site (grid)
6. **Vaccinations**
 - N or NA - received no vaccine
 - R - received rabies vaccines
 - D - received canine distemper vaccine
 - C - received canine distemper vaccine
 - RD - received rabies and canine distemper vaccine
 - RC - received rabies and canine distemper vaccine
 - SEN - this animal is a disease sentinel and will not receive vaccines during its lifetime
7. **ReproductiveStatus**
 - N - not active(ly reproductive) has not had kits this season (for females, for males we cannot tell)
 - L - lactating
 - SL - signs of lactation (but no longer actively lactating) has had kits this season
 - SV - there is one of these in the dataset and I think it is a mistake and should be SL
 - TD - testes distended (male ready to breed, we do not record this often as we specifically do not trap during breeding season which is Feb-March)
8. **AgeClass**
 - 0 - kit, born that year
 - 1, 2, 3, 4 - successive values given to record amount of tooth wear on molar, from 0 (none) to 4 (the most)
